DIRISA Service (SSO,DDT and DMP)

Thursday, 7 December 2023 14:30 (20 minutes)

DIRISA Services consist of services like Data Management Plan (DMP), Data Deposit Tool (DDT) and Storage request. All these services are accessible through single point of access called Single Sign On (SSO). DMP is a formal document that outlines how a researcher will handle data before, during and after the project is completed. Outlines the practices for collecting, organizing, backing up, and storing the data that will be generated. Fewer benefits of DMP are more visible, citable on research data, encourage data sharing and more collaboration. When done with data planning DDT store data so that research can start collecting data and store the data on DDT. Furthermore, with DDT user get 100GB for free and storage increase based on meeting requirements for storage increase. Storage request service is where users make requests when they need more storage.
