SAWS Climate Services and Infrastructure

Wednesday, 4 December 2024 11:00 (20 minutes)

The South African Weather Service (SAWS) is a key part of the country's weather system. SAWS runs a complex system of tools to observe weather. This includes manual weather stations, automatic rain measuring stations, automatic weather stations, weather radars, a network that measures sunlight, and a system to detect lightning. These systems give important information right away for predicting the weather and studying the sly he or, ng

are important for predicting extreme weather events like cyclones and coastal storms, which can serious affect communities and businesses. The SAWS climate infrastructure is a changing system that supports t country's work to fight against and adjust to climate change. South Africa is improving its ability to watch f predict, and react to climate-related problems by using new technologies, strong research efforts, and worki with internal and international communities.
