## **Trusted digital repository certification with Core Trust Seal: the ilifu experience from consortial collaboration to sustainable service.**

*Tuesday, 1 December 2020 12:45 (30 minutes)*

Funders of repositories and those who entrust their valuable data to them need to know whether their funds and their confidence are well placed. Stakeholder concerns are addressed in the international standard measure applied to the repository as being worthy of trust. While trust is a complicated concept, the meaning applicable here is that of a confident expectation that the data will be well managed and continue to be accessible over a “long” period of time. This paper will examine the path to trusted digital repository certification, as experienced by the research data management (RDM) project partners of the ilifu consortium.
